Tokenomics

The background

Bittorrent Chain has many advantages: EVM compatibility, very very very very low fees, interoperability with Tron, Ethereum and BSC.
But it has a few active projects and few users. WML wants to build on BTTC potential and bring some life to it in an entertaining and fun way.

The goal

Be the first 1B$ token on BTTC, easy!

How do we get there?

Wish Me Luck is a community project driven by luck. At the heart of the project is the WML token, deployed on Bittorrent chain. Every step of the project deployment will be initiated by users and their luck:

- Liquidity raising and token launch through the first FairLuckPad
- Luck based token distribution and incentives using the Luck Dispenser
- Buyback and distribution to keep user engagement and attractiveness

Fair Luckpad

The Fair Luckpad is a tool to ensure a smooth and equal opportunity launch, with a bit of spice added to it.

At the base is a "normal" fairlaunch contract, where every user has the same opportunities to obtain a share of the token at the same conditions as every other users, independently from the timing of the request. The first user applying has the same conditions as the last.

But luck plays a role, users will be assigned randomly a luck factor that will act as a multiplier for the pledge amount (min 100%, max 200%). Luck is determined using an Oracle to ensure fairness (Band).

Luck Dispenser

The dispenser is the heart of the project and will determine its success. The majority of the tokens will be placed inside the distribution contract. Users will interact with the contract to distribute the tokens based on luck. A few lucky recipients will get free tokens, most won't.

The user triggering the distribution will be rewarded for the help given to the project:
- Instantaneous WML rewards
- Bronze, Silver and Gold jackpots that will be awarded randomly to participating users

Buyback and distribution

The WML rewards will be obtained through buyback from the main LP. This will keep a positive pressure on token value.

The distribution using the luck dispenser will decrease over time and never end. A decreasing exponential rate will ensure that most of the tokens will be distributed in the first weeks of the project, pushing the market cap as much as possible.

Visibility on CMC and CG will help attract new users.

Tokenomics

- 1,000,000,000 tokens minted
- 99.9% to Luck Dispenser
- The rest (1000,000) goes to:
    - 10% to treasury wallet
    - 33.7% to LP
    - 56.3% to FairLuckpad

The liquidity raised during launch will go to:
- 60% LPs (WML/BTT and WML/USDT)
- 40% to treasury for incentives, marketing and development
